Our calculations — finite-χ singlets and exact orthogonal dimers
Square lattice: algebraic dimer decay
Singlets, χ=32
Singlets, χ=64
Singlets, χ=128
Orthogonal dimers: exact plane
|Connected correlation|
Orthogonal: asymptotic exponent 2
Singlets: finite-χ estimate p ≈ 1.30
(r=6–20); bulk exponent unresolved
Distance (nearest-neighbor spacings)
Kagome lattice: short dimer decay
Singlets, χ=18
Singlets, χ=32
Baseline fit: ξ=0.638 cells
|Connected correlation|
Projector cutoff 10⁻⁸
ξ remains cutoff dependent
Orthogonal occupation correlations:
exactly zero for separated bonds
(zero cannot appear on a log axis)
Distance (unit cells; 1 cell = 2 NN spacings)
